

Table Bases

Atc offers a wide variety of table bases in cast aluminum, stainless steel, extruded aluminum, galvanized and powder coated steel, cast iron and stainless steel clad steel plates.

Amanda bases are fabricated of type 201 stainless steel. Amanda bases were new in 2011 and are an exclusive design and material ideal for seaside environments. They have stainless steel columns and a cast aluminum spyder. Available in small medium and large sizes, as well as a rectangle model, bar height columns and a **flip version** to complete the line, the Amanda is a very elegant base and very well priced.

The **Andalusia base**, which looks identical to the original Dessi base from Spain, has come from China now for many years. The **Andalusia** base series is available only in black. Andalusia -3 bases used in pairs can be modified to provide ADA clearance under a 32" x 48" table top. The design of the bases was upgraded in 2015 as was the packaging with no price premium. The new bases are easier to assemble, more stable and solid in use and are much more robust as well.

Aspen bases flip and nest for easy storage of tables. Aspen is stocked in polished and Pepper powder coat. There is a new cart now available with an improved design that is half the price of the previous one, so it should be easier to sell carts.

Bistro cast iron bases are imported directly by us and have a superior quality level. We use a brass insert for the adjustable glides to avoid the problem of glides rusting frozen in the cast metal. We use a two bolt system on both the top and bottom to prevent the spyder from turning or the column turning in the base plate as is often the case with the single bolt system found on less expensive Bistro style bases.

Econox bases are a polished 304 stainless steel clad base over a plastic encased cast iron structure. It can be used in salty environments without fear. It uses the same columns as the Jennifer and can be made into bar heights with the same extensions.

Futura is a brushed type 201 stainless steel clad steel plate available in square, round and rectangle in various sizes. The Futura is very low profile and is standard with stainless steel columns and a cast aluminum spyder. Futura is available in a 28" diameter weighing 63 lbs and with a large spyder for carrying large tops. A special 28" comes with a larger column and is designed to handle an umbrella as well. There is also a Futura bolt-down. New in the stainless version are also a variable height 20" square that has a gas shock allowing infinite height adjustment from table to bar height and also from cocktail table (about 17")to table (about 29")

height. The low ones should be great for converting lounges to additional dining seats or for hotel rooms or suites cocktail tables to dining height. A 20" square with umbrella capability is also available in addition to the 28"

Futura is also available in Black, which is a powder-coat finish on a galvanized steel plate. A Black Futura rectangle and a 28" diameter have made the black line virtually equivalent to the Stainless version. Because of the zinc galvanizing, these are fine for outdoor use as well.

Jennifer bases are made with heavy weight aluminum castings, polished and clear coated, or with our Black Pepper powder-coated finish. We add a hidden cast iron weight to all Jennifer bases to provide added stability. The Black Pepper colored powder coat matches the Aruba chairs and Oviedo chairs. All Jennifer bases have a "D" ring as shown in the catalog which includes a purse hook for ease of chaining these together when they are left outside at night. The Jennifer 5 is suitable for tables up to 48" diameter. This year we are introducing an extra-large cast aluminum "X" spyder for the Jennifer-5 replacing the 5 leg cast iron spyder. The Jennifer 5. is available in both finishes and has larger feet, a larger column and of course a larger spyder. The extra-large ALUMINUM X spyder does better handle the teak tables since it matches with the X shape of the wood supports. The Jennifer rectangle is also becomes an ADA base with a special bracket replacing the cross bar **to be able to meet ADA wheelchair accessibility requirements.**

Rainbow is a new extruded aluminum flip base which is made of anodized aluminum, ideal for waterfront locations. Anodizing provides sure protection against corrosion. A new Flip Rectangle is now available. Additional non-flip versions of Rainbow will be added as manufacturing capacity becomes available.

The **Stone** base is specially designed with a welded steel square tube frame on top to handle ATCOstone™ and other large and heavy tops without any wiggle or other movement. This year there will be a small, a medium, a large and a rectangle to handle all sizes of the ATCOstone tops and other heavy tops.

B and C series, Ashley, Elgin, Litchfield and Cooper bases are available from us to fill out the line. The Ashley and Cooper as well as the chrome C-series are made with steel spinnings used over a cast iron base plate. While Bistro bases are cataphorized and can be used outside, other cast iron bases should not be used outside unless the client understands that they will have to be repainted regularly.

New **Zinc Galvanized steel** bases designed to work especially with the new Industrial Stone tops will be introduced shortly. These are still in the final stages of design and will be presented as soon as possible.
